PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	10/539,387	GERRITSEN ET AL.	
	<b>Examiner</b>	<b>Art Unit</b>	
	SAID BROOME	2628	

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 03 September 2009.
- 2a) ☐ This action is **FINAL**.                      2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-9 and 11-20 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☒ Claim(s) 6 is/are allowed.
- 6) ☒ Claim(s) 1-5, 7, 8, 11 and 13-20 is/are rejected.
- 7) ☒ Claim(s) 4, 9 and 12 is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All    b) ☐ Some \*    c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**DETAILED ACTION**

***Continued Examination Under 37 CFR 1.114***

A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 9/3/09 has been entered.

***Response to Amendment***

1. This office action is in response to an amendment filed on 9/3/2009.
2. Claim 1 has been amended by the applicant.
3. Claims 2-9 and 11-20 are original.
4. Claim 10 has been cancelled.

The indicated allowability of claims 1-5 and 11-20 is withdrawn in view of the newly discovered reference(s) to Buehler (US 2003/0160788). Rejections based on the newly cited reference(s) follow.

***Claim Rejections - 35 USC § 101***

35 U.S.C. 101 reads as follows:

Whoever invents or discovers any new and useful process, machine, manufacture, or composition of matter, or any new and useful improvement thereof, may obtain a patent therefor, subject to the conditions and requirements of this title.

Art Unit: 2628

Claim 13 is rejected under 35 U.S.C. 101 because claim 13 recites: “A computer readable medium carrying a computer program...”, in which recitation of the medium carrying a computer program provides evidence that the computer readable medium is a non-statutory carrier medium. Therefore claim 13 is not statutory in reference to the Specification on page 13 lines 17-20 where it is stated that the computer readable medium may be a medium transmitted over a network, such as the Internet, or sent through wireless telecommunication system. Claims that recite nothing but the physical characteristics of a form of energy, such as a frequency, voltage, or the strength of a magnetic field, define energy or magnetism, per se, and as such are nonstatutory natural phenomena. O’Reilly, 56 U.S. (15 How.) at 112-14. Moreover, it does not appear that a claim reciting a signal encoded with functional descriptive material falls within any of the categories of patentable subject matter set forth in § 101. First, a claimed signal is clearly not a “process” under § 101 because it is not a series of steps. The other three § 101 classes of machine, compositions of matter and manufactures "relate to structural entities and can be grouped as 'product' claims in order to contrast them with process claims." 1 D. Chisum, Patents § 1.02 (1994). The three product classes have traditionally required physical structure or material.

Claims 14-20 are rejected under 35 U.S.C. 101 as not falling within one of the four statutory categories of invention. While the claims 95 and 101 recite a series of steps or acts to be performed, a statutory “process” under 35 U.S.C. 101 must (1) be tied to another statutory category (such as a particular apparatus), or (2) transform underlying subject matter (such as an article or material) to a different state or thing. Claim 14 discloses a method for visualizing a 3D volume, however this method does not require a particular machine to implement the steps of the

Art Unit: 2628

method, and does not require transformation of underlying subject matter. Therefore the method disclosed in independent claim 14, and in dependent claims 15-20, are rejected under 35 U.S.C. 101 because the claimed methods of claims 14-20 do not qualify as statutory processes.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3, 5, 7, 8, 11 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Argiro et al. (hereinafter “Argiro”, U.S. Patent 5,986,662) in view of Kaufman et al. (hereinafter “Kaufman”, US 2004/0125103) and in further view of Buehler (US 2003/0160788).

Regarding claim 1, Argiro teaches a system for visualizing a three-dimensional (hereinafter “3D”) volume, in particular for medical applications (col. 6 lines 19-28: “*The Advanced Diagnostic Viewer (ADV) is a three-dimensional medical imaging workstation, comprised of software running on general-purpose, high-performance three-dimensional graphics hardware. The invention provides both a two-dimensional and a three-dimensional environment in which to view voluminous data organized into a plurality of voxels, each voxel having at least a voxel value. One particular embodiment of the invention provides a diagnostic environment for medical professionals such as radiologists.*” and is illustrated in Fig. 1: 100); the system including:

Art Unit: 2628

an input for receiving a three-dimensional set of data representing voxel values of the 3D volume (col. 4 lines 9-11: “*The retrieve data set component permits a user to load a previously acquired set of voxel data.*”);

a storage which stores the medical image data set (col. 30 lines 63-64: “*...the set of voxel data from a storage device...*” and Fig. 3: 120);

an output which provides pixel values of a two-dimensional (hereinafter “2D”) image representation for rendering (col. 3 lines 10-11: “*...to produce image pixels for display on a computer screen.*”); and

a processor which, under control of a computer program, processes the medical image data set to obtain the 2D image representation (col. 6 lines 19-28: “*The Advanced Diagnostic Viewer (ADV) is a three-dimensional medical imaging workstation, comprised of software running on general-purpose, high-performance three-dimensional graphics hardware. The invention provides both a two-dimensional and a three-dimensional environment in which to view voluminous data organized into a plurality of voxels, each voxel having at least a voxel value “, in which the software, or computer program product, causes the general-purpose graphic hardware to display three-dimensional data on a workstation, in which the hardware thereby comprises a processor to implement this display process) by performing the steps of:*

casting a ray from each pixel of the 2D image representation through the volume (col. 3 lines 1-4: “*...ray casting, the volume is positioned behind the picture plane, and a ray is projected perpendicularly from each pixel in the picture plane through the volume behind the pixel.*”);

Art Unit: 2628

traversing along the ray through at least a plurality of ray positions within the volume (col. 2 line 63 - col. 2 line 8: *“In one method of voxel rendering, called image ordering or ray casting, the volume is positioned behind the picture plane, and a ray is projected perpendicularly from each pixel in the picture plane through the volume behind the pixel. As each ray penetrates the volume, it accumulates the properties of the voxels it passes through and adds them to the corresponding pixel. The properties accumulate more quickly or more slowly depending on the transparency of the voxels.”* and col. 4 lines 11-16: *“...a protocol that includes preset adjustments for the volume-rendering of the data, based on the type of data that was loaded via the retrieve data set component. This protocol allows for an initial volume-rendering of the data that is logical in light of the type of data.”*, in which a ray is cast through portions of volume data with respect to a volume rendering protocol which renders the volume using corresponding penetrated positions of the ray as it traverses the volume); and

However, Argiro fails to teach selecting one of a plurality of rendering algorithms and/or rendering parameters, in dependence on the ray position, the selected one of the plurality of rendering algorithms and/or rendering parameters changing with the ray position, for each of the plurality of ray positions, calculating a contribution to a corresponding pixel value based on at least one voxel value within a predetermined range of the ray position using the selected one of the rendering algorithms and/or rendering parameters for each of the ray positions. Kaufman teaches for each of the plurality of ray positions, calculating a contribution to a corresponding pixel value based on at least one voxel value within a predetermined range of the ray position using the selected one of the rendering algorithms and/or rendering parameters for each of the ray positions (¶0008 lines 3-14: *“Volume rendering is one of the most common techniques for*

Art Unit: 2628

*visualizing the 3D scalar field of a continuous object or phenomenon represented by voxels at the grid points of the volume dataset...rays are cast from screen pixels through the volume dataset, and contributions of voxels along these sight rays are used to evaluate the corresponding pixel values.*“ and ¶0021 lines 1-12: “*...the present invention is a method and apparatus for performing approximate perspective volumetric ray casting of a three-dimensional (3D) volume dataset...The length of the volume dataset is calculated between the location of the nearest voxel to the viewpoint and the farthest voxel from the viewpoint.*“, in which rays are cast through a volume to produce a contributing pixel value within the entire volume dataset by penetrating the range and length of the dataset, using a selected rendering parameter, such as an approximate perspective ray casting). Therefore it would have been obvious to one skilled in the art at the time of invention to modify the volume rendering of Argiro with the calculated contributing pixel values of Kaufman because this modification ensures correct display of a volume data set through providing a rendering algorithm enabling the contributing pixel value of each corresponding ray to be calculated as it traverses through a range of the data set to provide accurate representation of the volume on a display screen.

However, Argiro and Kaufman fail to teach selecting one of a plurality of rendering algorithms and/or rendering parameters, in dependence on the ray position, the selected one of the plurality of rendering algorithms and/or rendering parameters changing with the ray position. Buehler teaches selecting one of a plurality of rendering algorithms and/or rendering parameters, in dependence on the ray position, the selected one of the plurality of rendering algorithms and/or rendering parameters changing with the ray position (¶0047 lines 3-5: “*...voxel ray tracers are preferably configured to conduct perspective ray tracing where the rays diverge with*

Art Unit: 2628

*each cast.”, in which a rendering parameter, such as implementation of a perspective ray tracing, is implemented based on the bundled position of the rays, in which the perspective ray tracing rendering parameters are executed in response to determination of ray whose positions have changed or diverged, in to a ray bundle, ¶0015 lines 8-11).* Therefore it would have been obvious to one skilled in the art at the time of invention to modify the volume rendering of Argiro and contributing pixel values of Kaufman with the selected rendering parameters of Buehler because this modification would enable efficient rendering of a volume data set through providing particular rendering parameters based on certain positions of the ray as is traverse through data, thereby improving rendering accuracy of the data traversed by the ray by enabling parameters of the rendering to be provided in response to the position of the ray.

Regarding claim 2, Argiro teaches the wherein the selecting of one of the plurality of rendering algorithms and/or rendering parameters is based on a-priori knowledge of at least one of the following: the volume, the medical situation, the clinical situation based on at least one of anatomical, medical and clinical knowledge of a medical expert (col. 4 lines 11-16: “...*a protocol that includes preset adjustments for the volume-rendering of the data, based on the type of data that was loaded via the retrieve data set component. This protocol allows for an initial volume-rendering of the data that is logical in light of the type of data.*” and col. 10 lines 43-45: “...*the protocols are generated a priori by clinical testing to determine the most appropriate presets for a particular data set.*”).

Regarding claim 3, Argiro and Kaufman fail to teach further including a 3D model of at least one object in the volume, the used one of the plurality of rendering algorithms and/or rendering parameters being selected in accordance with a relationship between each ray position

Art Unit: 2628

and the at least one object of the 3D model. Buehler teaches further including a 3D model of at least one object in the volume, the used one of the plurality of rendering algorithms and/or rendering parameters being selected in accordance with a relationship between each ray position and the at least one object of the 3D model (¶0047 lines 3-5: “...*voxel ray tracers are preferably configured to conduct perspective ray tracing where the rays diverge with each cast.*“, in which a rendering parameter, such as implementation of a perspective ray tracing, is implemented based on the bundled position of the rays, in relation to a 3D model, Fig. 1a, in which the perspective ray tracing rendering parameters are executed in response to determination of ray whose positions have changed or diverged, in to a ray bundle). Therefore it would have been obvious to one skilled in the art at the time of invention to modify the volume rendering of Argiro and contributing pixel values of Kaufman with the selected rendering parameters of Buehler because this modification would enable efficient rendering of a volume data set through providing particular rendering parameters based on certain positions of the ray as is traverse through data, thereby improving rendering accuracy of the data traversed by the ray by enabling parameters of the rendering to be provided in response to the position of the ray.

Regarding claim 5, Argiro teaches a rule prescribes for each of the plurality of ray positions at least one processing action at least in dependence on processing results of ray position along the ray that already been processed (col. 3 lines 1-8: “...*ray casting, the volume is positioned behind the picture plane, and a ray is projected perpendicularly from each pixel in the picture plane through the volume behind the pixel. As each ray penetrates the volume, it accumulates the properties of the voxels it passes through...The properties accumulate more quickly or more slowly depending on the transparency of the voxels.*“, in which a ray processes

Art Unit: 2628

*results of the ray at positions that have already been processed using an accumulation processing action of the volume rendering protocol).*

Regarding claim 7, Argiro teaches a storage which stores a plurality of protocols for controlling the traversing along the ray (col. 11 lines 7-17: “...there are 1-N protocols 186, where N is the number of protocols 186...The external configuration file specifies which protocol selector fields are to be matched with which protocol names.”, col. 10 lines 51-53: “Protocols thus include presets for the visual controls governing the viewing of the volume-rendering of the voxel data...” and in col. 3 lines 1-4: “...volume rendering is the use of the entire voxel data set to create an image. In one method of voxel rendering, called...ray casting, the volume is positioned behind the picture plane, and a ray is projected perpendicularly from each pixel in the picture plane through the volume behind the pixel.”, where a plurality of protocols are stored, such as the volume rendering protocol for implementing ray traversal).

Regarding claim 8, Argiro teaches wherein the storage includes a plurality of predetermined protocols which control the selection of the rendering algorithm and/or rendering parameters, each of the protocols corresponding to one of a plurality of anatomical regions of the patient (col. 11 lines 7-17: “...there are 1-N protocols 186, where N is the number of protocols 186...The external configuration file specifies which protocol selector fields are to be matched with which protocol names.” and col. 4 lines 11-16 and 25-29: “...a protocol that includes preset adjustments for the volume-rendering of the data, based on the type of data that was loaded via the retrieve data set component. This protocol allows for an initial volume-rendering of the data that is logical in light of the type of data...also providing different presets of those controls that correspond to particular types of anatomical or other data that is commonly encountered.”, in

Art Unit: 2628

*which the protocol file includes a plurality of protocols, which are preset or pre-designated for a related type of data, such as a anatomical region).*

Regarding claim 11, Argiro teaches the computer program is operative to cause the processor to enable a human operator to select at least one protocol form the plurality of stored protocols for processing the volume (col. 12 lines 41-55: “*A user, such as a radiologist or a technician, changes the pre-selected protocol by selecting one of the alternatives 214, which then becomes protocol 212.*”); and store a selection of the human operator in association with an identity of the operator for subsequent retrieval (col. 12 lines 41-55: “*...current protocol 212 initially shows the pre-selected protocol...A user, such as a radiologist or a technician, changes the pre-selected protocol by selecting one of the alternatives 214, which then becomes protocol 212.*”, in which the protocol component of the system, as shown in Fig. 2: 110, enables subsequent user change of pre-selected protocols to a new protocol, in which each of the protocols are retrieved from a plurality of protocols stored in a file, col. 11 lines 7-17: “*...there are 1-N protocols 186, where N is the number of protocols 186...The external configuration file specifies which protocol selector fields are to be matched with which protocol names.*”, where the system would consequently contain a processing unit to implement the software to of the protocol component to enable subsequent retrieval of user selection and modification to the protocols).

Regarding claim 13, Argiro teaches a computer readable medium carrying a computer program for causing a processor to process a three-dimensional set of data representing voxel values of a 3D volume (col. 6 lines 19-28: “*The Advanced Diagnostic Viewer (ADV) is a three-dimensional medical imaging workstation, comprised of software running on general-purpose,*

Art Unit: 2628

*high-performance three-dimensional graphics hardware. The invention provides both a two-dimensional and a three-dimensional environment in which to view voluminous data organized into a plurality of voxels, each voxel having at least a voxel value “ and shown in Fig. 3: 108, in which the software, or computer program, causes the general-purpose graphic hardware to process three-dimensional data, in which the hardware thereby comprises a medium readable by that hardware to use the processor to implement this process) depicting an anatomical region of a patient (Fig. 3: 122) to obtain a 2D image having a plurality of pixels of the 3D volume by projecting the 3D volume onto an imaginary 2D projection screen (col. 4 lines 17-34: “The image gallery component displays these initial volume-rendered images of the data...the user in more particular is able to refine the view or views of the selected image. The examination viewer component provides the user with exacting controls in the viewing of the image...The examination viewer component also allows the user to fly around and through the data, to obtain the correct view sought. The user is able to select a number of snapshots of such views, or create a video recording of the views. The report generator/viewer component permits the user to assemble these views...” and col. 14 lines 25-32: “...viewer component 114 permits display of an image of a patient's data with selected settings by volume view and...by inside view, outside view, and MPR orthogonal or oblique views; and, by volume view only, which is a large three-dimensional rendering.”, where the volume data is projected onto a display to obtain a two-dimensional representation on a screen from a defined point of view) by controlling the processor to perform the steps of:*

from a memory which stores a plurality of rendering algorithms/parameters, selecting a subset of the rendering algorithm/parameters in accordance with an anatomical region depicted

Art Unit: 2628

by the 3D volume (col. 11 lines 7-17: “...there are 1-N protocols 186, where N is the number of protocols 186...The external configuration file specifies which protocol selector fields are to be matched with which protocol names.” and col. 4 lines 11-16 and 25-29: “...a protocol that includes preset adjustments for the volume-rendering of the data, based on the type of data that was loaded via the retrieve data set component. This protocol allows for an initial volume-rendering of the data that is logical in light of the type of data...also providing different presets of those controls that correspond to particular types of anatomical or other data that is commonly encountered.”);

casting a ray through each pixel of the 2D image and into the 3D volume (col. 3 lines 1-4: “...ray casting, the volume is positioned behind the picture plane, and a ray is projected perpendicularly from each pixel in the picture plane through the volume behind the pixel.”); and

stepping along the ray through at least a plurality of ray positions within the volume under control of a protocol that selects one of the subset of rendering algorithms/parameters in dependence on the ray position (col. 2 line 63 - col. 2 line 8: “In one method of voxel rendering, called image ordering or ray casting, the volume is positioned behind the picture plane, and a ray is projected perpendicularly from each pixel in the picture plane through the volume behind the pixel. As each ray penetrates the volume, it accumulates the properties of the voxels it passes through and adds them to the corresponding pixel. The properties accumulate more quickly or more slowly depending on the transparency of the voxels.” and col. 4 lines 11-16: “...a protocol that includes preset adjustments for the volume-rendering of the data, based on the type of data that was loaded via the retrieve data set component. This protocol allows for an initial volume-rendering of the data that is logical in light of the type of data.”, in which a ray is cast through

Art Unit: 2628

*portions of volume data with respect to the volume rendering protocol which renders the volume using corresponding penetrated positions of the ray as it traverses the volume);*

However, Argiro fails to teach for each of the plurality of ray positions using the selected rendering algorithm/parameter to calculate a contribution to a pixel value of the pixel corresponding to the ray based on at least one voxel value within a predetermined range of the ray position and wherein a plurality of different rendering algorithms/parameters are used to generate the pixel values of the 2D image from the voxels of the 3D volume. Kaufman teaches for each of the plurality of ray positions using the selected rendering algorithm/parameter to calculate a contribution to a pixel value of the pixel corresponding to the ray based on at least one voxel value within a predetermined range of the ray position (¶0008 lines 3-14: “*Volume rendering is one of the most common techniques for visualizing the 3D scalar field of a continuous object or phenomenon represented by voxels at the grid points of the volume dataset...rays are cast from screen pixels through the volume dataset, and contributions of voxels along these sight rays are used to evaluate the corresponding pixel values.*“ and ¶0021 lines 1-12: “*...the present invention is a method and apparatus for performing approximate perspective volumetric ray casting of a three-dimensional (3D) volume dataset...The length of the volume dataset is calculated between the location of the nearest voxel to the viewpoint and the farthest voxel from the viewpoint.*“, *in which rays are cast through a volume to produce a contributing pixel value within the entire volume dataset by penetrating the range and length of the dataset*), therefore it would have been obvious to one of ordinary skill in art at the time of invention to modify the volume rendering of Argiro with the calculated contributing pixel values of Kaufman because this modification ensures correct display of a volume data set through

Art Unit: 2628

providing a rendering algorithm that enables the contributing pixel value of each corresponding ray to be calculated as it traverses through an entire range of the data set to provide accurate representation of the range of the volume on a display screen.

However, Argiro and Kaufman fail to teach wherein a plurality of different rendering algorithms/parameters are used to generate the pixel values of the 2D image from the voxels of the 3D volume. Buehler teaches wherein a plurality of different rendering algorithms/parameters are used to generate the pixel values of the 2D image from the voxels of the 3D volume (§0022 lines 1-8: “*Ray casting is a method to determine visible objects and pixels within a graphical scene 150 as shown in FIG. 1a. Ray casting is one method of conducting ray tracing that advances (casts) one ray for each pixel within the graphical scene 150 from the perspective viewer 106. With each cast one or more graphical objects are tested against each ray to see if the ray has "collided" with the object...*” and §0047 lines 3-5: “*...voxel ray tracers are preferably configured to conduct perspective ray tracing where the rays diverge with each cast.*”, in which different rendering parameters are utilized, such as traditional ray casting, and perspective ray tracing rendering). Therefore it would have been obvious to one skilled in the art at the time of invention to modify the volume rendering of Argiro and contributing pixel values of Kaufman with the selected rendering parameters of Buehler because this modification would enable efficient rendering of a volume data set through providing particular rendering parameters based on certain positions of the ray as it traverses through data, thereby improving rendering accuracy of the data traversed by the ray by enabling parameters of the rendering to be provided in response to the position of the ray.

Art Unit: 2628

Claim 14 is rejected under 35 U.S.C. 103(a) as being unpatentable over Argiro in view of Kaufman.

Regarding claim 14, Argiro teaches a method of visualizing a 3D volume by processing a three-dimensional set of data representing an anatomical region of a patient (Fig.3: 122), which 3D volume is defined by a three-dimensional set of data representing voxel values of a 3D array of voxels of the 3D volume (col. 2 line 67 - col. 3 line 4: *"In one method of voxel rendering...or ray casting, the volume is positioned behind the picture plane, and a ray is projected perpendicularly from each pixel in the picture plane through the volume behind the pixel."*), as a 2D image defined by pixel values of a 2D array of pixels of a 2D image on an imaginary 2D projection screen (col. 4 lines 17-34: *"The image gallery component displays these initial volume-rendered images of the data...the user in more particular is able to refine the view or views of the selected image. The examination viewer component provides the user with exacting controls in the viewing of the image...The examination viewer component also allows the user to fly around and through the data, to obtain the correct view sought. The user is able to select a number of snapshots of such views, or create a video recording of the views. The report generator/viewer component permits the user to assemble these views..."*, where the volume data is projected onto a display to obtain a two-dimensional representation on a screen), the method comprising:

casting a ray through each pixel of the 2D image and into the 3D volume (col. 3 lines 1-4: *"...ray casting, the volume is positioned behind the picture plane, and a ray is projected perpendicularly from each pixel in the picture plane through the volume behind the pixel."*); and

Art Unit: 2628

stepping along the ray through at least a plurality of ray positions within the volume under control of a protocol that selects one of the subset of rendering algorithms/parameters in dependence on the ray position (col. 2 line 63 - col. 2 line 8: *"In one method of voxel rendering, called image ordering or ray casting, the volume is positioned behind the picture plane, and a ray is projected perpendicularly from each pixel in the picture plane through the volume behind the pixel. As each ray penetrates the volume, it accumulates the properties of the voxels it passes through and adds them to the corresponding pixel. The properties accumulate more quickly or more slowly depending on the transparency of the voxels."* and col. 4 lines 11-16: *"...a protocol that includes preset adjustments for the volume-rendering of the data, based on the type of data that was loaded via the retrieve data set component. This protocol allows for an initial volume-rendering of the data that is logical in light of the type of data."*, in which a ray is cast through portions of volume data with respect to the volume rendering protocol which renders the volume using corresponding penetrated positions of the ray as it traverses the volume); and

at least one of displaying (Fig. 10: 208) and storing the 2D image (Fig. 9: 112);

However, Argiro fails to teach for each of the plurality of ray positions using the selected rendering algorithm/parameter to calculate a contribution to a pixel value of the pixel corresponding to the ray based on at least one voxel value within a predetermined range of the ray position and wherein a plurality of different rendering algorithms/parameters are used to generate the pixel values of the 2D image from the voxels of the 3D volume. Kaufman teaches for each of the plurality of ray positions using the selected rendering algorithm/parameter to calculate a contribution to a pixel value of the pixel corresponding to the ray based on at least one voxel value within a predetermined range of the ray position (§0008 lines 3-14: *"Volume*

Art Unit: 2628

*rendering is one of the most common techniques for visualizing the 3D scalar field of a continuous object or phenomenon represented by voxels at the grid points of the volume dataset...rays are cast from screen pixels through the volume dataset, and contributions of voxels along these sight rays are used to evaluate the corresponding pixel values.” and ¶0021 lines 1-12: “...the present invention is a method and apparatus for performing approximate perspective volumetric ray casting of a three-dimensional (3D) volume dataset...The length of the volume dataset is calculated between the location of the nearest voxel to the viewpoint and the farthest voxel from the viewpoint.”, in which rays are cast through a volume to produce a contributing pixel value within the entire volume dataset by penetrating the range and length of the dataset), therefore it would have been obvious to one of ordinary skill in art at the time of invention to modify the volume rendering of Argiro with the calculated contributing pixel values of Kaufman because this modification ensures correct display of a volume data set through providing a rendering algorithm that enables the contributing pixel value of each corresponding ray to be calculated as it traverses through an entire range of the data set to provide accurate representation of the range of the volume on a display screen.*

***Allowable Subject Matter***

Claims 4, 9 and 12 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter: In regards to claim 6, the prior art fails to teach a system for visualizing a three-dimensional

Art Unit: 2628

(hereinafter “3D”) volume, in particular for medical applications; the system including: an input for receiving a three-dimensional set of data representing voxel values of the 3D image; a storage for storing the data set; an output for providing pixel values of a two-dimensional (hereinafter “2D”) image for rendering; and a processor for, under control of a computer program, processing the data set to obtain a 2-dimensional representation of the volume by projecting the volume onto an imaginary 2D projection screen from a predetermined viewpoint by for each pixel of the 2D projection image: casting a ray from the viewpoint through the pixel and through the volume; traversing along the ray through at least a plurality of ray positions within the volume under control of a protocol that determines a rendering algorithm and/or rendering parameters in dependence on the ray position; and for each of the plurality of ray positions using the determined rendering algorithm/parameters to calculate a contribution to a pixel value of the pixel based on at least one voxel value with a predetermined range of ray positions, wherein the protocol is rule-based; wherein a rule prescribes for each of the plurality of ray positions at least one processing action at least in dependence on processing results of ray position along the ray that already been processed wherein the processing action includes at least one of the following: jumping forward or backward along a ray to a particular ray position, and resuming processing from that position; switching a stepping direction along a ray between forward and backward as seen from the viewpoint; changing a step size that determines a next ray position with respect to a current ray position in the stepping direction; changing a 3-dimensional direction of a ray starting from a particular position; switching to another rendering algorithm; adapting rendering parameters for controlling the rendering algorithm; switching to another feature detection

Art Unit: 2628

method, which determines the type of information that is going to be visualized by the rendering algorithm, therefore claim 6 is allowable.

### ***Response to Arguments***

Applicant's arguments with respect to claims 1-5, 7-9 and 11-20 have been considered but are moot in view of the new ground(s) of rejection.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SAID BROOME whose telephone number is (571)272-2931. The examiner can normally be reached on M-F 8:30am-5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ulka Chauhan can be reached on (571)272-7782. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
